### More advantages of an audience response system

- 1. Increased student attention**
- 2. Enhanced knowledge transfer**
- 3. Increased willingness to participate thanks to anonymity:** Students are free to ask about something unknown without having to expose themselves or being afraid to ask a „stupid question“. Additionally, teachers' bias towards certain students can be prevented.
- 4. Pre-formulated questions can be sent directly to teachers (anonymously).** Often formulating a question is a great challenge for students – it requires students to know exactly where the problem lies. This gives students more time to think about their question and put it in concrete terms.
- 5. Create interactive teaching environments:** feedbackr offers the possibility to compare oneself and one's results with those of other participants. Thus, it creates interactivity in the lecture hall which leads to a changed teaching situation. By involving students, personal interest in the topic and in teaching is increased.
- 6. Real-time-feedback:** Students and teachers can see immediately which knowledge and competences have been gained and where there is still need for further explanation.
- 7. Data acquisition and analysis:** Due to its web-based nature, feedbackr – in contrast to votes by raising your hand – allows to save, display and analyze the results. This allows teachers to record developments over time and students to view their individual progress.
